INTRODUCTION

This document provides an overview of Corian® exterior cladding material in ventilated façade systems for the North American region.

Building practices and codes vary throughout the world. The guidance provided in this document was developed for the United States and Canada and may not be applicable to other countries. For guidance for other countries please check the appropriate country at http://www.corian.com or contact a local Corian® Design representative. Laws, building and safety codes governing the design, engineering and construction of installations vary widely. It is the responsibility of the purchaser to ensure that proper building practices and codes are followed for the location of the installation.

A. ADVANTAGES AND DESIGN FLEXIBILITY OF CORIAN® EXTERIOR CLADDING MATERIAL FOR BUILDING FACADES

Corian® exterior cladding material is a solid, non porous, homogeneous surfacing material, composed of about $\frac{1}{3}$ acrylic resin (also known as polymethylmethacrylate or PMMA), and about $\frac{2}{3}$ mineral, aluminum trihydrate (ATH). For more information on the composition of the material, please consult the Safety Data Sheets (SDS) available via the mds.dupont.com site. Supplied in sheets, it can be fabricated with conventional woodworking tools into virtually any design.

The construction guidelines in this document were developed specifically for use with the DuPont products and third party products recommended for use by DuPont that are referenced in this document. The information set forth herein is furnished free of charge and based on technical data that DuPont believes to be reliable. It is intended for use by persons having technical skill, at their own risk. Since conditions of use are outside our control, DuPont makes no warranties, expressed or implied and assume no liability in connection with any use of this information. Nothing herein is to be taken as license to operate under or a recommendation to infringe any patents.
Advantages of Corian® Exterior Cladding Material for Building Facades

Corian® exterior cladding material offers many advantages in a ventilated façade application:

High performance durability
- Great resistance to impact
- Resistant to humidity
- Resistant to salt fog and sulfur dioxide (SO₂)
- Resistant to fungi and bacteria
- Will not delaminate nor decompose

Structural Performance
- Lightweight for reduced structural load
- Flexural and tensile strength provide excellent resistance to wind loads
- Compatibility with typical building components, structural silicone and sealants

Fire Performance
- Low flame spread
- In the event of fire, Corian® exterior cladding material will not melt and will not create burning droplets
- Low smoke generation
- When burned, it primarily releases carbon oxides and does not contain toxic halogenated gases

Weatherability
- UV stable colors with excellent colorfastness available
- Resistant to bulk water absorption
- Weather-resistant system minimizes leakage from wind-driven rain (ability to seam reduces the number of joints)
- Excellent freeze-thaw resistance
- Excellent resistance to chemicals, detergents and environmental pollutants

Environment – Durability
- Ventilated façade allows for thicker insulation and therefore may lower energy costs
- Is durable, long-lasting. Panels can be repaired, if necessary, rather than replaced (less material is needed or discarded over the life of the building)
- Ventilated façade can be used for cladding renovation to reach new insulation requirements
- Is inert, safe in use and has low VOC content
- Is nontoxic

Maintenance
- There are no pores to trap dirt
- Neither the surface nor the edges need to be sealed, painted or protected
- Colors run through the entire thickness and cannot wear away or delaminate, making the product inherently robust
- Even covered with some of the most difficult dirt and graffiti, the panels can be restored to their original appearance through cleaning and sanding
- Under normal conditions, will require annual cleaning only, with standard agents such as water and detergents

Renewability
If excessive surface damage is incurred after installation, Corian® exterior cladding material has unique repair possibilities. In most cases it can be repaired on site with little difficulty, using abrasive scouring pads and an orbital sander.

Design Flexibility with Corian® Exterior Cladding Material

Large panels
Large panels can be easily built up by adhering standard panels with inconspicuous, reinforced seams. The main limitations are the ability of the substructure to accommodate movement due to thermal expansion, the weight capacity of the mounting system, and the necessary expansion gaps (revealed or open joint designs). The maximum dimensions are typically governed by the capability of the design to accommodate the anticipated thermal movement.

Colors run through the entire thickness, so edges are the same color as the rest of the sheet, and revealed joints will show no black gaps.

Translucency
Corian® exterior cladding material will allow some diffused light transmission, depending on color. In general, solid light colors such as white and beige are the most translucent, and dark colors are the least translucent. The Corian® Illumination Series has been specifically designed with more translucency than the standard colors. Special considerations for these materials are described in the Corian® Illumination Series Fabrication Bulletin.

Corian® exterior cladding material can also be fabricated to achieve different levels of light transmission by selectively back-cutting the material to different thickness. As the material is cut thinner, it allows more light to pass through. The effect generated will depend on the combination of material and lighting system variables. See notes below on the potential effects of material removal on material flatness and load capabilities.
**Surface Texturing, Patterning and Engraving**

There are many different surface treatments that can be applied to Corian® exterior cladding material, including machining or engraving (sanding, routing, sandblasting, water jet, etc.), texturing (thermal molds and presses), and layering (laminating). Different techniques can be used for surface finishing, partial surface cutting or full cutting for different shapes, patterns or inlays. Different finishes (semi-gloss, mat or rough-textured) can be achieved with various sanding or polishing steps. These techniques enable high levels of customization for unique, one-of-a-kind designs.

Surface machining of Corian® sheet is typically done with high-speed routing tools to create desired features or shapes. Since Corian® exterior cladding material is relatively easy to cut and finish, without the need for specialized diamond abrasives and saws, fabrication can be done quickly and with a high level of quality. High-speed routers can achieve a fine level of detail for surface cutting and can also be driven by CNC controls to achieve intricate patterns and textures.

Depending on the extent of material removal from the uniform sheet material thickness, thermofoaming may be required to eliminate material warpage to produce flat panels after texturing or machining. Thinning out sections of material also needs to be considered in the façade system engineering, relative to material load capabilities. If significant material removal is planned from the uniform sheet material thickness, use of thicker 19 mm (3/4”) material should be considered versus the standard 12 mm (1/2”) sheet material.

**Thermoforming**

A broad range of geometric or natural patterns of differing textural depth and dimension can be molded into the surface to achieve an unlimited variety of architectural finishes. Surface molding and forming of Corian® exterior cladding material, is typically done with medium-temperature ovens and pressure molds.

Surface texturing, patterning, engraving, and molding techniques can be combined with shape thermoforming, to create a variety of two and three dimensional structures. Sheets of 12 mm (1/2”) thickness may be formed as small as a 3” (75 mm) inside radius depending on color. Laminating multiple layers of Corian® sheet can be done with flat and thermoformed pieces. The possibilities are almost unlimited.

**B. AVAILABLE COLORS AND DIMENSIONS**

Many exterior cladding materials fade or discolor in time due to weathering, but in many cases the obtained natural patina may be acceptable or even desirable (e.g. copper roofing). Individual Corian® exterior cladding material colors change differently and most often exhibit changes in gloss and whitening which can be renewed with cleaning and/or sanding. These changes are more obvious in saturated, chromatic and dark colors and least obvious in whites, lighter colors and many of the earth tones. Ultimately it is up to the end user to determine if these characteristics are acceptable in the application.

The selection below represents colors that are expected to meet architectural guidelines for color change of less than 5∆E_ab units over 10 years (ASTM D2244). Glacier White and Designer White are predicted to have color change of less than 2∆E_ab units over 10 years.

**North America Corian® Exterior Cladding Material Prorated 20-Year Limited Product Warranty for Commercial and Residential Exterior Cladding Applications**

This warranty applies to Corian® exterior cladding material, supplied in connection with exterior cladding projects and selected from the Corian® exterior cladding portfolio, (the Product).

DuPont warrants to the original purchaser of the Product only that:

- at the time of delivery, the Product will meet the Product specifications,
- during the first 10 years after initial installation, Glacier White and Designer White will not fade or change by more than 2 ∆E_ab (ASTM D2244) units
- during the first 10 years after initial installation, all other colors than previously stated will not fade or change by more than 5 ∆E_ab (ASTM D2244) units
- it will remain free from peeling, swelling, separating and chipping during the first 20 years after initial installation.

This limited warranty requires that the Product has been purchased from Corian® Design directly or one of Corian® Design's authorized channel partners and has been stored, handled, applied and maintained in accordance with Corian® Design’s technical instructions and all applicable building codes. This is a Product only warranty, not a fabrication and/or installation warranty.

The warranty herein does not cover Joint Adhesive or DuPont™ Joint Adhesive 2.0, it covers only Corian® sheets products.

For more information about this warranty, please contact Corian® Design directly by calling 1-800-426-7426, Option 1. Or contact us via the www.corian.com website.
**Figure B-1 – Corian® Exterior Cladding Standard Collection**

Standard colors will be offered in **60" x 144" x 1/2"** (1524mm x 3658mm x 12mm), and are special fire rated grade material.

- Designer White
- Glacier White
- Cameo White
- Vanilla
- Bisque

**Figure B-2 – Corian® Exterior Cladding Accent Collection**

Accent colors will be offered in **30" x 144" x 1/2"** (762mm x 3658mm x 12mm) and are special fire rated grade material. Accent colors may be made available in wider sizes. Please contact your local Corian® Design representative for further details regarding sizes and any restrictions or limitations regarding where these materials can be installed.

- Dove
Corian® exterior cladding material has many desirable attributes for decorative exterior applications. These include good color stability, low moisture absorption, and resistance to stains, environmental pollutants, detergents, humidity, and freeze-thaw conditions. Performance properties of Corian® exterior cladding material for an array of industry standards relevant for outdoor use are summarized in Table C-1.

**Table C-1 Performance Properties of Corian® Exterior Cladding Material**

*Not evaluated per CAN/ULC-S134

For applications where NFPA 285 Standard Fire Test Method for Evaluation of Fire Propagation Characteristics of Exterior Non-Load-Bearing Wall Assemblies Containing Combustible Components is required, special system assemblies are needed. Typically, NFPA 285 testing is required above 40 feet on Type I to IV buildings. There are many fire jurisdictions in the United States. Some may have stricter requirements and some will permit Corian® cladding above 40 feet height without special construction. Consult the local building jurisdiction for applicable requirements.

Currently, Corian Exterior Cladding panels can comply with IBC 2015 requirements relative to fire in all Type V construction. For Types I to IV buildings, combustible cladding, i.e., Corian® cladding, can be used up to 40 feet height per the IBC 2015 without special system construction, provided foam plastic insulation is not included in the assembly.

Above 40 feet in height for Type I to IV buildings, cladding must be non-combustible or pass specific requirements per the IBC 2015. In addition to meeting a self/flash ignition limit and surface flammability, smoke, and flame spread requirements, the IBC requires combustible cladding materials to pass an ignitibility material test (NFPA 268 Standard Test Method for Determining Ignitibility of Exterior Wall Assemblies Using a Radiant Heat Energy Source) and an assembly fire propagation test, i.e., NFPA 285.

Corian® products pass the NFPA 268 ignitibility test and a rain screen assembly consistent with the construction outlined in this bulletin, along with important additional elements, has passed the NFPA 285 propagation test. Those details needed to pass the NFPA 285 propagation test are available from DuPont. Pictures of tests appear in Figures 18 to 20. Since solid surface materials are not listed in the IBC, an engineering judgment letter from a qualified fire consultant may be required to apply DuPont demonstrated technology to a specific building. DuPont can work with architects and designers to meet the IBC requirements and recommend consultants familiar with the technology utilized.
D. GENERAL FAÇADE GUIDELINES FOR CORIAN® EXTERIOR CLADDING MATERIAL

For exterior wall cladding applications, Corian® exterior cladding material has typically been installed as a ventilated rain screen façade. Ventilated façades are designed to breath with a space between the cladding and the outer wall – an ideal location for insulation materials. Figure D-1 is one example of an installation. Corian® exterior cladding material panels are mechanically fixed to substructure fixed to the external wall of new or existing (retrofit) buildings. The “breathing” cavity or envelope systems, combined with DuPont™ Tyvek® weather barriers, offer possibilities for high insulation values, with an insulation layer fixed to the external wall, and contribute to a healthy indoor climate.

Figure D-1: Ventilated Façade Clasp / Rail

Corian® exterior cladding material panels must be mounted on an adequate substructure with corrosion resistant fixings in such a way the panels are not subject to any kind of tension and can move freely.

When engineering the substructure, the following aspects are important:
- Wind load
- Density and maximum distances between fixing points
- Ventilation requirements
- Freedom of movement of the panel
- Size of the panels
- Anchoring to existing structural wall
- Applicable legal requirements (local building codes)

The substructure (fixing system) usually used to mount Corian® panels is a mechanical fixing system based on an aluminum grid system, consisting of vertical profiles “T” or “L” shape, mounted on aluminum brackets to connect to the wall. The substructure supplier has to check the substrate, according to official construction recommendations.

The cladding panels are hung on the horizontal profile “C” shape by the brackets (or clamps) with reverse “C” shape, that are attached to the panel with a specific connection method (see chapter “invisible fixing methods”).

Figure D-2: Horizontal Cross Section Demonstrating Design Principles (Tyvek® generic)

Figure D-2 illustrates the general principles of a Corian® ventilated façade. The substructure has vertical profiles (8) that are anchored into the load bearing wall (1). This wall is generally insulated (2) and protected with Tyvek® Commercial Wrap® D or Tyvek® Fluid Applied WB (3). The ventilation cavity (4) allows passive air convection that provides natural thermal and moisture management. The horizontal profiles (5) attach to the vertical profiles (8). The Corian® panels are mounted to clamps or clasps (7) prior to hanging on the horizontal profile (5).
Detail of Clamps

There are three types of clamps, adjustable, standard, and fixed. Adjustable clamps are used on two or more of the fixture points along the top of the panel. These allow vertical alignment of the panel while allowing horizontal movement. One clamp in the top row is a fixed clamp (created by drilling a hole in the clamp and rail and inserting a bolt). This clamp restricts horizontal movement and is fixed after the panel is in place. It is important that only one fixed clamp is used per panel to allow thermal expansion/contraction. Standard clamps are used on rest of the panel. These allow horizontal and vertical movement, while restricting any movement out of plane.

Figure D-3: Adjustable clamp on rail
Figure D-4: Standard clamp on rail
Figure D-5: Fixed clamp on rail

Clamp Fixing Distance

The number of clamps and their spacing is important to both provide sufficient support for Corian® external cladding and to minimize wind load deflections. Clamps should be placed no closer than 2 inches (50 mm) and no farther than 6 inches (150 mm) from any edge of the panel. The recommended maximum spacing between clamps should be provided by the substructure supplier only and be compliant with local building codes and maximum wind load.

Based on different ventilated façade projects around the globe, a typical maximum spacing between clamps is 26 inches both horizontally and vertically for a wind load up to 24 psf (1140 Pa), associated with a wind speed of approximately 100 mph (161 km/h). Higher wind loads will require tighter spacing of clamps.

Important aspects for engineering a ventilated façade with Corian® exterior cladding material:

Expansion Joints and Panel Connections

Panels should be attached to the substructure so they are fully supported, yet able to move relative to the substructure to accommodate thermal expansion and contraction. Corian® exterior cladding material, as any other material, will expand or contract with temperature changes. The thermal expansion coefficient of Corian® material is $2.2 \times 10^{-5}/\text{°F}$ ($3.9 \times 10^{-5}/\text{°C}$), larger than typical building substructure construction materials. Therefore, the fixings method and expansion gaps (X) should be designed to allow the material to move freely. As general guidance, a variation in length and width of 1/32-inch per foot of panel dimension (3 mm/m) should be considered in the design, based on 120°F (49°C) potential temperature variation from the installation temperature.

Figure D-6: Open Joint
Figure D-7: Sliding Strip
Figure D-8: Overlap Joint
Please note an overlap system with half of the thickness of the sheet will always show small square openings in the corners, reference Figure D-9: Open shiplap and Figure D-10: Closed shiplap. Alternatives to eliminate the gaps and completely “close” the façade include:

1) adding a strip system to the overlap system or

2) routing three levels into the overlap system. Panel corners will not be as damage tolerant if three level panel corners are used.

If the overlap system is combined with the strip system, the number of openings in the façade can be reduced or eliminated for one story structures. In this case the horizontal overlap is done with one third of the thickness of the sheet, so that the horizontal seam-depth is the same as the vertical seam-depth of the strip system. The sliding strip is positioned vertically in the grooved panels. This strip may be longer than individual panels up to the length of Corian® sheet material. The strip is either attached to one panel with silicone in the groove or pinned in place in one location. This allows a gap free façade up to one story high. In between each strip there must be a gap to allow for expansion. By raising the gap above ground level it becomes less visible.

Contact your Corian® Design representative for suggestions for routing three levels into the overlap system.

- All routed material features should have rebated inside minimum radius of 1/16" (1.5 mm) to avoid creating stress risers. It is also recommended to round all edges of outside corners to the same 1/16" (1.5 mm) radius. The rounded edges will be safer to handle and more damage resistant.
- The cladding panels must not have any structural function.
E. INVISIBLE FIXING SYSTEMS

Invisible fixing systems hide the connecting hardware on the back of the Corian® exterior cladding material panels. These systems hold the panels securely, supporting the weight of the panel and providing stiffness to minimize wind deflection.

The KEIL system is an example of a mechanical attachment in which an insert is expanded within an undercut hole. When a bolt is installed in the conical mechanical insert it will expand, locking itself into the undercut of the hole. To properly install the fastener, it is very important all details are precisely calculated for the project, taking into account the length of the insert, the length of the bolt, the thickness of the clasp or attached hardware and the depth of the undercut hole. The clasp or attached hardware are designed to move relative to the underlying substructure to accommodate thermal expansion and contraction. Estimates of thermal movement should consider seasonal temperature changes.

F. FACADE DETAILS DRAWINGS PROPOSALS

The following drawings illustrate a number of typical design details. It is important gaps (X) are properly sized to allow for thermal expansion of the panels. Measurement X indicate the expansion gap between panels.

All drawings are proposals. As such, DuPont does not approve or disapprove any designs or drawings or assume any liability for the design selected. Any and all liability for a design rests solely with the architect, designer, and/or façade installer and building owner.
Figure F-2: Horizontal Cross section of open joint

Figure F-3: Horizontal section of open joint with concrete expansion joint

Figure F-4: Internal Corner

Figure F-5: Internal corner end

Figure F-6: Outside corner
Solutions for Corners
The ability to inconspicuously seam Corian® exterior cladding material creates a number of options for corners. A few of possibilities are shown below:

Figure F-7: Open 45° corner

Figure F-8: Open butt corner

Figure F-9: Angled (glued) corner

Figure F-10: Angled (glued) corner with overlap

Figure F-11: Thermoformed corner

Figure F-12: Rebate corner for small panels
As the name suggests, ventilation is an important aspect of ventilated façade. There must be sufficient clearance behind the panels, as well as the top and bottom to allow air flow.
