

CORIAN® ENDURA™

FABRICATOR SILICA DUST HAZARD AND MITIGATION AWARENESS DECLARATION

Corian® Endura™ (high performance porcelain) is not hazardous as a finished product, however there are hazards that are associated primarily with its processing, or fabrication. Operations such as sawing, routing, drilling and sanding can generate dust that can contain particles of crystalline silica. Overexposure to airborne silica dust can cause silicosis. This information is also stated in the corresponding product Safety Data Sheets that can be found by going to the SDS Finder link at the bottom of www.Dupont.com.

DuPont has a Silica Safety Video that is used to educate our customers and those who fabricate our product regarding this hazard. This is a 9-minute education video on the health hazards associated with silica dust exposure, as well as engineering controls, personal protective equipment needed and fabrication techniques/procedures to be used to reduce or eliminate this exposure.

This video can be found on our Corianquartz.com website and is embedded in our Partner Resource page. Go to www.Corianquartz.com → Menu → Professionals → Partner Resources, or just use the web address below to take you directly to the Partner Resource page:

<https://www.corianquartz.com/-partner-resources-> **NOTICE: all references and precautions regarding Corian® Quartz in this video apply to Corian® Endura**

It is DuPont's expectation that all Corian® Endura™ customers, and those who fabricate these products, watch this video.

By signing this document, you are declaring that you, as a representative of your company, have viewed the Silica Safety Video and understand the requirements to eliminate personnel from exposure to silica dust. You further agree to show the Silica Safety Video to all personnel before they begin working with Corian® Endura™.
